

General use of rules:

Positive head atom: -

- possible EDB atoms,
- negative EDB atoms,
- possible IDB atoms,
- negative IDB atoms.

Jun 24-10:09

Recall Stratification:

(e is EDB)

a(1)	S ₁ : a
a(3)	S ₂ : b
b(x) ← ¬a(x)	S ₃ : c
c(x) ← ¬b(x)	S ₄ : d
d(x) ← ¬c(x)	S ₅ : e
e(x) ← ¬d(x)	

computation: evolution of predicates

number of strata can be
recomputed from the program
= the length of the longest (negative) path
in the dependency graph

for this simple example, each
T_p actually is only T_p¹.

Jun 24-10:55

recall positive programs :

a(1). a(2).
b(x) ← a(x).
c(x) ← b(x).
d(x) ← c(x).

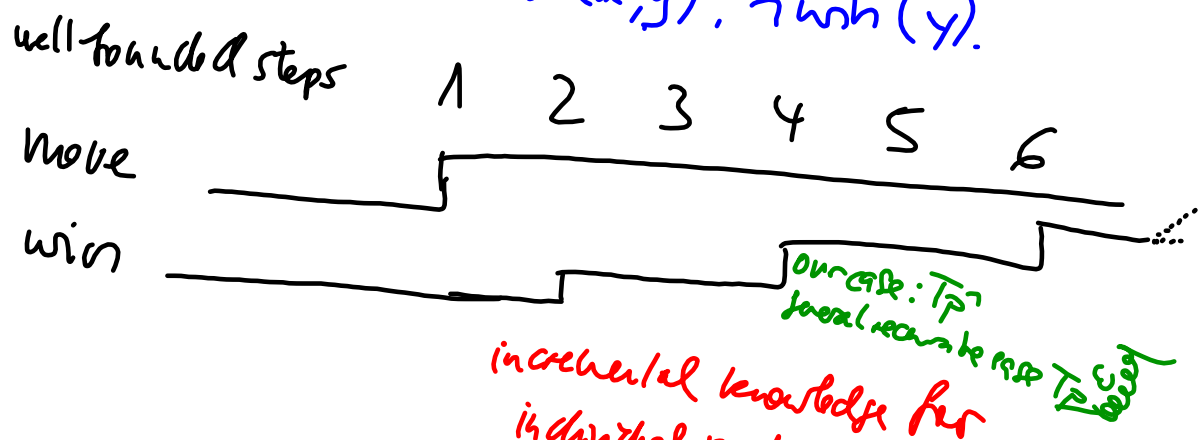

Computation T_P^ω , in this simple example = T_P^4

with a recursive rule, recall reachability (Kondratiev)
 $\Rightarrow T_P^\omega$ is necessary

Jun 24-11:03

So back to well founded

$win(x) :- more(x,y), \neg win(y).$

incremental knowledge for individual predicates

Jun 24-11:06

Consider the following extended game prog:

$wh(x) :- move(x,y), \neg wh(y).$

$red(x) :- wh(x), move(x,y), wh(y).$

~~$green(x) :- wh(x), \neg x:(move(x,y), wh(y)).$~~

$\Rightarrow 2$ Tp-steps in each well-founded round not in De/leg!

Jun 24-11:11

Consider the reduct for that ^{extended} program

$\mathcal{R}_0 = \emptyset$; ie. $wh = \emptyset$

$P = \{ move(a,b), move(b,k), \dots \}$ $\hat{=}$ rule $move(i,j) :- true.$
 the two mbs from the previous slide \mathcal{I}

$P_{\mathcal{I}} = \{ move(a,b) :- true,$
 $move(b,k) :- true,$
 $wh(a) :- move(a,b), \neg wh(b).$
 $wh(s) :- move(a,s), \neg wh(\emptyset).$
 \vdots
 $wh(i) :- move(b,i), \neg wh(k).$
 \vdots
 $wh(j) :- move(k,j), \neg wh(i).$

Stick-deletes:

• 2nd item does not delete anything

$\Rightarrow P_{\mathcal{R}_0}$

from the second rule:

$red(a) :- wh(a), move(a,b), wh(b).$
 \vdots

Jun 24-11:23

$$T_{P_{\alpha_0}}^1(\emptyset) = \{ \text{move}(a,f) \dots \text{move}(b,k) \dots \}$$

only the moves = EDP

$$T_{P_{\alpha_0}}^2(\emptyset) = T_{P_{\alpha_0}}(\downarrow) = \{ \text{move}(a,f) \dots \text{move}(b,k), \text{win}(a), \dots \text{win}(b) \}$$

$$T_{P_{\alpha_0}}^3(\emptyset) = \{ \dots \} \cup \{ \text{red}(a) \}$$

\Rightarrow we need T_P^ω here!

$$= : \mathcal{H}_1$$

Jun 24-11:33

Consider a differently extended program:

$\text{win}(x) :- \text{move}(x,y), \neg \text{win}(y).$

$\text{lose}(y) :- \neg \text{win}(y).$

Consider evaluation

$\mathcal{H}_1: \{ \text{win}(a), \text{win}(b), \text{win}(i), \text{lose}(f), \text{lose}(k), \text{lose}(n), \text{lose}(j) \}$ obvious!

(obvious) agree

Jun 24-11:43

reduct P_{α_1} :

$P_g = \{ \text{move}(\dots) \dots \dots$

~~$w_h(a) :- \text{move}(a,b), \neg w_h(b),$~~
 $w_h(a) :- \text{move}(a,c), \neg w_h(c),$
 \vdots
 ~~$w_h(e) :- \text{move}(e,a), \neg w_h(a),$~~
 $w_h(c) :- \text{move}(c,d), \neg w_h(d),$
 \vdots
 ~~$l_{a_1}(a) :- \text{not } w_h(a),$~~
 \vdots
 ~~$l_{a_1}(c) :- \text{not } w_h(c),$~~ true
 ~~$l_{a_1}(h) :- \text{not } w_h(h),$~~ true
 ~~$l_{a_1}(m) :- \text{not } w_h(h),$~~ true
 \vdots
 $\}$

(! cover our inhibition that e is not won)
 a is not lost! because it is known to be won

$=: P_{\beta_1}$

Jun 24-11:44

evaluate P_{β_1} :

$T_{P_{\beta_1}}(\cancel{\alpha_1})$

it will redene everything that was ^{safely} ~~correctly~~ denied before

$= \{ \text{move}(a,b), \dots, (\text{move} \dots) \}$

$\{ \text{lose}(c), \text{lose}(m), \text{lose}(h), \dots \}$

\downarrow FRIDAY

Jun 24-11:52
