

# Recall ODMS ideas :

- select complexity head  
 Rows body  
 where ...
- correlated joins From t<sub>1</sub> X X.P X
- navigation, path expressions  
 → graph data models
- data exchange format : O/F  
 serialization of data → Unicode string

Nov 3-14:08

## Distributed relational Queries :

Query :

- give me all tables in these databases that have a "name" column

DEA  
 select t's name  
 from all-my-databases d,  
 d.tables t,  
 t.columns c  
 where c's name = "name"

Correlated join as in SQL

⇒ this query only inspects the schema

Same in correct schema SQL

select t  
 from → d,  
 d → t,  
 d::t → c  
 where c = "name"
